Turfgrass Nematodes

Introduction

Living in the cold, Northeastern U. S., we are fortunate to have less plant parasitic nematode problems than those living further south. There are approximately twelve different species of plant parasitic nematodes that cause problems on various turfgrass species. Plant parasitic nematodes cause major problems on warm season grasses. Cool season grasses can also have substantial decline and damage symptoms. Nematode feeding can open sites for other pathogens which can cause more severe damage.

Symptoms and Signs

Above ground symptoms of nematode damage include chlorosis, wilting, and reduced growth. Symptoms are often found in a random patchy pattern that become more apparent when the turf is stressed by high temperatures, a lack of moisture or poor soil fertility. Below ground, symptoms may include galled roots, the presence of cyst bodies, and/or poor, declining, discolored root systems. Feeding sites are ideal locations for entry of fungal plant pathogens and diseases caused by these organisms are often found in conjunction with high nematode populations. Laboratory soil sample analysis is the only way to detect the kinds of nematodes associated with a problem and may be necessary to identify the most effective control measures.

Disease Cycle

Nematodes are microscopic, worm-like, animals with lifecycles that include one egg stage, four juvenile stages, and one adult stage. Nematodes overwinter in the egg phase, within the dead females body, or in plant material. As the weather warms in the spring, the nematodes become active and begin feeding. Some female species become enlarged when mature and either produce eggs out the hind end of the female or the female body houses the eggs.

Management Strategies

There are no known resistant varieties of turfgrass. The best control method is keeping the plants as healthy as possible by fertilization and reducing stressful situations. Although fumigants may be available for some sites, these products are typically highly toxic and must be applied by professionals. Careful consideration should be made prior to making a decision to use one of these products as these toxic materials can be harmful to other beneficial organisms of the turf ecosystem.
This publication may contain pesticide recommendations. Changes in pesticide regulations occur constantly, some materials mentioned may no longer be available, and some uses may no longer be legal. All pesticides distributed, sold, and/or applied in New York State must be registered with the New York State Department of Environmental Conservation (DEC). Questions concerning the legality and/or registration status for pesticide use in New York State should be directed to the appropriate Cornell Cooperative Extension Specialist or your regional DEC office. **READ THE LABEL BEFORE APPLYING ANY PESTICIDE.**

**The Plant Disease Diagnostic Clinic** at Cornell University is located at 334 Plant Science Building, Ithaca, NY, 14853. Phone: 607-255-7850, Fax: 607-255-4471, Email: kls13@cornell.edu or slj2@cornell.edu

Commercial applicators should refer to the appropriate pest management guidelines, or contact their local Cooperative Extension Office for more information on currently registered products.
